Battle of the conjunctions: Disjunctive vs. compensatory course placement

Terrence Willett, Cabrillo College
Mallory Newell, De Anza College
Loris Fagioli, Irvine Valley College

November 17, 2016

http://www.rpgroup.org/projects/multiple-measures-assessment-project
Agenda

• Project Overview
• Research Basis
  • Impact Analysis and Relationship to Equity
• Comparing different ways to combine test and non-test data and information in placement Systems
• Integration with Common Assessment Initiative (CAI)
Project Overview

**Collaboration**
- CAI
- CCCCCO
- Cal-PASS+
- RP Group
- 60 CCCs

**Model Development**
- English
- Math
- ESL
- Reading
- Non-cognitive Variables
- Self-reported transcript data

**Engagement**
- Local replication
- Webinars
- Professional development
- Support
- Pilot results inform statewide implementation
Growing body of evidence

• **Weak relationship** between assessment tests and college course outcomes: bit.ly/CCRCAssessment

• **Incredible variability** in cut scores; CCCs often use HIGHER cut scores than 4-year institutions: bit.ly/NAGB2012

• **Underestimates** students of color, women, first generation college students, low SES: bit.ly/DefiningPromise

• Long thread of research in the CCCs
  – Hetts, Fuenmayor, & Rothstein, 2012 http://www.lbcc.edu/PromisePathways
Why Multiple Measures?

• Tests used in isolation have been under-placing students
• Multiple measures
  • provides a more complete picture of student ability
  • provides a way to increase the accuracy of placement, particularly reducing underplacement
• are required by law (Title V)
• supported by statewide senate
Methods

- Matched data from high schools and community colleges in CalPASS Plus
- Recursive decision trees with Poisson model
- Rules and R code:
  
  `http://rpgroup.org/projects/multiple-measures-assessment-project/decision-rules`

```r
# load a data file into R
setwd("C:/Users/MyName/Documents/ProjectFolder")

MyData <- read.delim("DataFile.txt", quote = ",", row.names = NULL, 
stringsAsFactors = FALSE)
```
Variables Explored in the Models

• High School Cumulative GPA (primary predictor)
• Grades in high school courses
• CST scores
• Advanced Placement course taking
• Taking higher level courses (math)
• Delay between HS and CCC (math)
• Type of English or Math course
Transfer Level English
**Transfer Level MMAP Rule Sets**

<table>

</table>
Various Placement Systems and Their Impact on Student Equity
What are some possible placement systems?

**Disjunctive placement:**
Take the highest placement of multiple measures
i.e. Test or High School (HS) Transcripts or AP score or EAP or...
Recommended by MMAP

**Compensatory placement:**
Combination of all multiple measures with equal or varying weights
i.e. Placement = Test + HS GPA + HS Course + AP score + ...

**Conjunctive placement:**
Lowest placement where all measures agree
i.e. exceed both Test score threshold and HS GPA criteria
Highly restrictive
Not recommended by the CCCCCO

Special thanks to Dr. Barry Gribbons of College of the Canyons for first highlighting these systems to the MMAP Team
Disjunctive

Compensatory

Conjunctive
How can we compare these systems?

• **Accuracy**: The proportion of students who are correctly predicted to be successful or to be unsuccessful.

• **Other Classification Metrics**: Positive predictive value, Sensitivity, Specificity, etc.

• **1 year throughput rate**: The number of students successfully completing the gatekeeper course at the end of a course sequence divided by the number of students in the initial cohort within 1 year.

• **Underrepresented Minority Placement Rate**: Equity and disproportionate impact are major considerations when evaluating the performance of placement systems.
Classification metrics

- **Accuracy**: proportion of students correctly predicted to be successful or to be unsuccessful = \(\frac{TP+TN}{TP+FP+TN+FN}\)

- **PPV**: Positive predictive value, the number of passing students (i.e., true positives) divided by the number of students predicted to succeed = \(\frac{TP}{TP+FP}\)

- **NPV**: Negative predictive value = \(\frac{TN}{TN+FN}\)

- **Specificity**: \(\frac{TN}{TN+FP}\) = 1 - Type I error = True Positive Rate

- **Sensitivity**: \(\frac{TP}{TP+FN}\) = 1 - Type II error = Power = 1 - False Positive Rate

TP=True Positive, FP=False Positive

TN=True Negative, FN=False Negative
Information that can be used to evaluate placement systems. Two way contingency table or “confusion matrix”.

<table>
<thead>
<tr>
<th></th>
<th>Predicted to Fail</th>
<th>Predicted to Pass</th>

</tbody>
</table>
Response Operating Curve
R Resources for Model Metrics

• “caret” package for testing many models
• "e1071" corrects some errors in caret
• "pROC" draws ROC curves
• Max Kuhn caret site and webinar slides
Managing Errors

• Typically have trade off in specificity v. sensitivity and must consider consequences of false positives v. false negatives.
  • High Sensitivity
    – Airport security
    – Allow students a chance to pass a course
  • High Specificity
    – Convicting someone of a serious crime
    – Protect students from failing a course
Types of Placement Error

- **Overplacement**: Student is placed above their ability to succeed. Highly visible.
- **Underplacement**: Student could have been successful at a higher level than where placed. Tends to be invisible.
- Current placement systems tend to result in much greater underplacement error.
- Total placement error is minimized when over- and underplacement are balanced.
- Consequences to students of each error not equal
Evaluating Placement Systems

**Disjunctive placement:**
Take the highest placement (Test or MMAP)
Recommended by MMAP

**Compensatory placement:**
Logistic regression (combines Test, MMAP simultaneously)
Run with two cut-values: 0.70, 0.50

**Conjunctive placement:**
Only if Test and MMAP in agreement
Highly restrictive
Not recommended by the CCCCCO
Accuracy: Statistics Course

Accurate Placement in College Statistics

- Conjunctive: 61%
- Compensatory (0.70): 57.40%
- Disjunctive (0.70)*: 67%
- Compensatory (0.50): 68.10%
Positive Predicted Value (PPV): Statistics Course

PPV for College Statistics by Placement System

Proportion Correctly Predicted to Pass

- Conjunctive: 73%
- Compensatory (0.70): 77.90%
- Disjunctive (0.70): 65%
- Compensatory (0.50): 69.70%
One Year Throughput Rate: College Statistics Course

Statistics Class Throughput rate by Placement System

Percent placed accurately:
- Conjunctive: 13%
- Compensatory (0.70): 17.10%
- Disjunctive (0.70): 32%
- Compensatory (0.50): 40.80%
Percentage of Transfer-placed Students who are URM

Percentage Transfer-placed Students who are URM by Placement System

- Conjunctive: 42%
- Compensatory (0.70): 47.50%
- Disjunctive (0.70): 55%
- Compensatory (0.50): 56.40%
Placement of Under-represented Minorities into Transfer English by Assessment Model

- Original: 40%
- Conjunctive: 27%
- Disjunctive: 49%
- Compensatory: 34%
Summary of Placement Models

• No single metric is sufficient but several well-chosen metrics can allow for a more informed decision
• Throughput is an important metric to consider
• PPV can be calculated for all placement systems; metrics that require a True Negative cannot be calculated for disjunctive placement systems.
• When requiring >70% probability of passing transfer-level course, disjunctive models have higher access and throughput than compensatory models
• If compensatory model is set to a 0.50 criterion or cut-value, it can outperform a disjunctive model (with a .70 criterion) in terms of accuracy, access, PPV and throughput
• The conjunctive model was very restrictive and had the lowest throughput rates and URM placement rates
Interactive rCharts

http://ramnathv.github.io/rCharts/
Integration of MMAP with CAI
Integration of MMAP with CAI

• Note: Common Assessment updates currently on pause
• Common Assessment platform will house a transcript data repository
  – repository will be source-agnostic & store transcript data from variety of sources, including CalPASS & self-report via CCC Apply
  – statewide decision trees programmed into platform, for internally generated Multiple Measures placement recommendation
  – expect data points used in MM placement recommendation
• Students will receive a single placement recommendation created from a disjunctive placement model
